

tradition

Tradition is not about keeping ashes;
it means keeping a flame burning.

Jean Jaurés

fire and

flame

Fire has always had something ethereal about it.
In Greek mythology, it was reserved for the gods alone,
until Prometheus artfully stole it and gave it to the mortals.

vision

MeierGuss is a traditional family firm dedicated to the two elements of fire and water, with the focus on products that play a big part in ensuring a smooth flow in everyday life. MeierGuss has developed, produced and distributed drainage technology products and tree protection systems for several decades.

A high willingness to invest and a good feeling for the changing requirements of the market have formed a solid basis for the corporate group, for whom over 300 employees are in action at 3 locations. MeierGuss is one of the market leaders and points the way ahead for an assured future from the location Rahden and Limburg – “Made in Germany“.

innovation

Our fast-moving world requires a high level of flexibility and the ability to innovate. MeierGuss' Product Development department is equipped with the latest technology. Creativity and know-how are applied to the development and improvement of our own products and product lines, always keeping pace with the times.

Individual customer requirements can be rapidly and professionally dealt with thanks to our in-house prototype construction. In this case, 3-D CAD developments ensure optimal implementation of all our tasks and problem definitions.

fully

coordinated

The MeierGuss iron foundry is without a doubt one of the most modern and most efficient in the drainage technology segment. Immaculate cast products, which are either further processed in the warehouse as cast iron articles or in our in-house concrete works as concrete/cast iron goods, are manufactured using perfect interplay between high-technology equipment.

The dipping plant plays an important part in environmental protection in both senses of the word. The automated dipping and drying process allows solvent-free and water-soluble lacquer to be applied extremely economically and reliably to the components. The energy required for this process is extracted 100% from the cupola furnace waste heat.

high tech

Drainage technology and tree protection systems are segments which are subject to extreme deadline and cost pressure. That means all the production processes must mesh perfectly. Efficient, motivated employees, complex high-tech equipment and many years of experience are guarantees for a smooth process and maximum reliability as regards quality and on-time delivery.

products

MeierGuss products are oriented on market requirements both at home and abroad. Well-known customers, in the commercial as well as in the public sector, place their trust in the high quality, functionality and long life of MeierGuss products, which are already in use in many countries.

design

Even a manhole cover can be a work of art. Covers with a motif are among the „fine arts“ of manhole covers.

In this context MeierGuss enjoys a reputation for meeting its customers‘ requirements with creativity and sensitivity. After all, a cover with a motif should be a source of pleasure for many years.

in harmony

Fire and water are the complementary elements that symbolise the cycle of life and ensure the future of life on our planet in a very practical way.

As a forward-looking company, MeierGuss attaches a lot of importance to environmentally-friendly production processes, careful use of resources and the development of products that contribute to protecting and preserving the environment.

When technology is in harmony with nature, it plays its part in safeguarding our habitat.
